APPLICATION FOR QUALITY ENGINEERING / SDET — RESEARCH & DEVELOPMENT

Dear SentinelOne Engineering Team,

I am writing to express my strong interest in joining SentinelOne's Research & Development engineering organization in Bengaluru. Over the past 5+ years, I have specialized in cybersecurity product quality engineering—validating enterprise Endpoint Protection (EPP), EDR agent telemetry, false-positive mitigation, and building scalable automation frameworks.

Having closely followed SentinelOne's industry-leading work on autonomous Singularity XDR and endpoint agent architecture, I understand that maintaining high-detection efficacy without latency or false-positive disruption is critical to enterprise trust. I bring proven hands-on experience in testing mission-critical security workflows:

- **Endpoint Agent & EPP Validation:** Hands-on experience testing real-time process monitoring, parent-child process tree hierarchies, recursive process termination, and automated quarantine behaviors across Windows and Linux environments.
- **False-Positive & Regression Engineering:** Designing and executing systematic verification matrices on clean enterprise software installers and deployment scripts to eliminate incorrect quarantine actions and prevent customer downtime.
- **Test Automation & Systems Troubleshooting:** Built reusable UI, API, and cross-platform automation suites using Java, Selenium WebDriver, TestNG, Python, and REST Assured, complemented by deep system-level log investigation (`/var/log`, Windows Event IDs 4624/4625).

Interactive Security Testing Portfolio: I have documented my testing architectures, verification steps, and interactive test simulation harnesses at: https://harshsrivastava1997.github.io/xdr-testing-portfolio/

I would welcome the opportunity to discuss how my cybersecurity domain expertise and automation engineering background can contribute to the resilience of SentinelOne's products.

Sincerely,

Harsh Srivastava

Senior Test Automation Engineer • Cybersecurity Quality Specialist
